

Instructions for combining the old and new ballast plate

UPDATED BALLAST PLATE AND BALLAST CONNECTOR SUPRA

The **Supra ballast plate and ballast connector** have been updated. The sides of the ballast plate are now higher, and the edge has been folded over. This makes the plate stronger, easier to handle and more comfortable to work with. It is also easier to pick up from a stack or pallet.

The ballast plate and ballast connector work exactly the same as before.

If you have a project where you are using an old ballast connector with a new ballast plate (or the other way around), there's no need to worry, they are fully compatible. Just make sure to assemble them in the correct order: place the old ballast plate at the bottom (1), the new ballast plate on top (2), and then fasten everything with the screw as usual (3). See the illustration below:

Have you discovered the **new cable clip** in the pillar yet? We've updated it too. It now holds up to 4 cables on each side, keeps the cables firmly in place, and lets you attach cable bundles to both sides with cable ties.
